

A Train Tracker

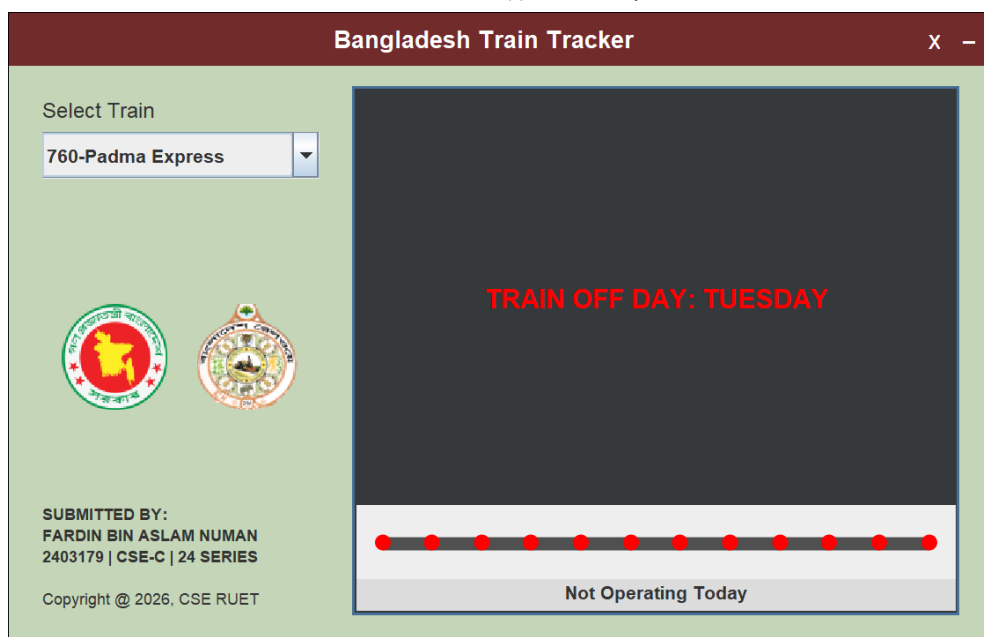

Introduction:

A train tracking system is a software-based solution designed to monitor and display the real time status of trains. It enables users to access essential information such as current location, schedule, upcoming stations and journey progress through an interactive interface. By utilizing stored data and system time, the application simulates live tracking and helps passengers make informed travel decisions, improving convenience and time management

Outputs:

JFrame GUI (a): Normal Day

JFrame GUI (b): OFF Day

Conclusion:

The Train Tracker application demonstrates how OOPS concepts can be applied to build a practical and user friendly system. Through the use of classes, interfaces, file handling and GUI components, the program efficiently manages train data and presents it in a structured format. This project not only enhances understanding of Java Swing and OOP principles but also reflects how real world transportation systems can be digitally modeled to improve user experience and operational efficiency
