

CSE 1201

Data Structure

Prof. Dr. Md. Nazrul Islam Mondal

What is a queue?

- It is an ordered group of homogeneous items of elements.
- Queues have two ends:
 - Elements are added at one end called *rear*.
 - Elements are removed from the other end called *front*.
- The element added first is also removed first (FIFO: First In, First Out)

Queue Specification

- Definitions: (provided by the user)
 - *MAX_ITEMS*: Max number of items that might be on the queue
 - *ItemType*: Data type of the items on the queue
- Operations
 - Enqueue (ItemType newItem)
 - Dequeue ()

Queue Operation

Enqueue (ItemType newItem)

- *Function*: Adds newItem to the rear of the queue.
- *Preconditions*: Queue has been initialized and is not full.
- *Postconditions*: newItem is at rear of queue.

Queue Operation

Dequeue (ItemType& item)

- *Function*: Removes front item from queue and returns it in item.
- *Preconditions*: Queue has been initialized and is not empty.
- *Postconditions*: Front element has been removed from queue and item is a copy of removed element.

Queue Operation

Implementation issues

- Implement the queue as a *circular structure*.
- How do we know if a queue is full or empty?
- Initialization of *front* and *rear*.
- Testing for a *full* or *empty* queue.

Queue Operation

q.Enqueue(2)

q.Enqueue(3)

q.Enqueue(5)

q.Dequeue(item)
item = 2

q.Dequeue(item)
item = 3

q.Enqueue(10)

q.Enqueue(20) ???

Let the queue elements
"wrap around"

```
if(rear == maxQue - 1)
    rear = 0;
else
    rear = rear + 1;
```

or

```
rear = (rear + 1) % maxQue;
```

Queue Operation

q.Enqueue(30)

q.Enqueue(50) ???

The queue is full !!

What is the condition for a full queue ?

`rear + 1 == front`

q.Dequeue(item)
item = 5

q.Dequeue(item)
item = 10

q.Dequeue(item)
item = 20

q.Dequeue(item)
item = 30

The queue is empty !!

What is the condition for an empty queue ?

`rear + 1 == front`

We cannot distinguish between the two cases !!!

Queue Operation

Make *front* point to the element **preceding** the front element in the queue (one memory location will be wasted).

q.Enqueue(30)

BEFORE !!

The queue is full !!

What is the condition for a full queue ?

$\text{rear} + 1 == \text{front}$

q.Dequeue(item)
item = 10

q.Dequeue(item)
item = 20

q.Dequeue(item)
item = 30

The queue is empty !!

What is the condition for an empty queue ?

$\text{rear} == \text{front}$

Based on this solution, one memory location is wasted !!!

Queue Operation

Initialize *front* and *rear*

Queue Operation

Queue is empty now!!

rear == front

Queue: Enqueue() function

Topic 1: Write an Algorithm to insert a new element in a queue

n : size of $a[]$
 x : input variable
Array Elements: $a[0] \dots a[n-1]$

Queue : Enqueue() function

Topic 1: Write an Algorithm to insert a new element in a queue

```
void enqueue(int x){
    if(rear==n-1){
        rear=0;
        if(rear==front)
            {printf("Queue is full.\n");
             rear=n-1;}
        else
            a[rear]=x;
    }
    else{
        if(rear+1==front)
            printf("Queue is full.\n");
        else
            a[++rear]=x;
    }
}
```

Initially top = -1

Queue : Dequeue() function

Topic 1: Write an Algorithm to delete element from a queue

n : size of $a[]$

Array Elements: $a[0] \dots a[n-1]$

Queue: Dequeue() function

Topic 1: Write an Algorithm to delete element from a queue

```
void dequeue(){
    int x;
    if(rear==front)
        printf("Queue is empty..\n");
    else
    {
        if(front==n-1)
            front=0;
        else
            front++;
        x=a[front];
    }
}
```

Home Work

- Write a C program to implement a circular queue using following menu.

- 1. Push
- 2. Pop
- 3. Display

Enter your option (1-4):

- 4. Exit

Recursion

What is recursion?

- Sometimes, the best way to solve a problem is by solving a smaller version of the exact same problem first
- Recursion is a technique that solves a problem by solving a smaller problem of the same type

Problems defined recursively

- There are many problems whose solution can be defined recursively

Example: *n factorial*

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ (n-1)! * n & \text{if } n > 0 \end{cases} \quad \text{(recursive solution)}$$

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ 1 * 2 * 3 * \dots * (n-1) * n & \text{if } n > 0 \end{cases} \quad \text{(closed form solution)}$$

Coding the factorial function

- Recursive implementation

```
int fact( int n)
{
    if (n==0) // base case
        return 1;
    else
        return n * factl(n-1);
}
```

Final value = 120

Coding the factorial function (cont.)

- Iterative implementation

```
int Factorial(int n)
{
    int fact = 1;

    for(int count = 2; count <= n; count++)
        fact = fact * count;

    return fact;
}
```

Another example:

n choose k (combinations)

- Given n things, how many different sets of size k can be chosen?

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1} \quad 0 < k < n \quad (\text{recursive solution})$$

$$\binom{n}{k} = \frac{n!}{k!(n-k)!} \quad 0 < k < n \quad (\text{closed-form solution})$$

with base cases:

$$\binom{n}{1} = n \quad (k=1), \quad \binom{n}{n} = 1 \quad (k=n)$$

Ackerman function

It's a recursive function with two arguments each of which can be assigned any non-negative integer.

Ackermann function is defined as:

$$A(m, n) = \begin{cases} n + 1 & \text{if } m = 0 \\ A(m - 1, 1) & \text{if } m > 0 \text{ and } n = 0 \\ A(m - 1, A(m, n - 1)) & \text{if } m > 0 \text{ and } n > 0. \end{cases}$$

Examples:

$$A(0, 2) = 2 + 1 = 3$$

$$A(1, 0) = A(1 - 1, 1) = A(0, 1) = 1 + 1 = 2$$

$$\begin{aligned} A(1, 1) &= A(1 - 1, A(1, 1 - 1)) = A(0, A(1, 0)) \\ &= A(0, 2) = 2 + 1 = 3 \end{aligned}$$

Ackerman function: $A(1,2)$

Solve $A(1, 2)$?

Answer:

Given problem is $A(1, 2)$

Here $m = 1, n = 2$ e.g $m > 0$ and $n > 0$

Hence applying third condition of Ackermann function

$$A(1, 2) = A(0, A(1, 1)) \text{ ————— (1)}$$

Now, Let's find $A(1, 1)$ by applying third condition of Ackermann function

$$A(1, 1) = A(0, A(1, 0)) \text{ ————— (2)}$$

Now, Let's find $A(1, 0)$ by applying second condition of Ackermann function

$$A(1, 0) = A(0, 1) \text{ ————— (3)}$$

Now, Let's find $A(0, 1)$ by applying first condition of Ackermann function

$$A(0, 1) = 1 + 1 = 2$$

Now put this value in equation 3

$$\text{Hence } A(1, 0) = 2$$

Now put this value in equation 2

$$A(1, 1) = A(0, 2) \text{ ————— (4)}$$

Now, Let's find $A(0, 2)$ by applying first condition of Ackermann function

$$A(0, 2) = 2 + 1 = 3$$

Now put this value in equation 4

$$\text{Hence } A(1, 1) = 3$$

Now put this value in equation 1

$$A(1, 2) = A(0, 3) \text{ ————— (5)}$$

Now, Let's find $A(0, 3)$ by applying first condition of Ackermann function

$$A(0, 3) = 3 + 1 = 4$$

Now put this value in equation 5

$$\text{Hence } A(1, 2) = 4$$

$$\text{So, } A(1, 2) = 4$$

Ackerman function

Table

$m \backslash n$	0	1	2	3	4	n
0	1	2	3	4	5	$n + 1$
1	2	3	4	5	6	$n + 2 = 2 + (n + 3) - 3$
2	3	5	7	9	11	$2n + 3 = 2 \cdot (n + 3) - 3$
3	5	13	29	61	125	$2^{(n+3)} - 3$
4	13 $= 2^{2^2} - 3$	65533 $= 2^{2^{2^2}} - 3$	$2^{65536} - 3$ $= 2^{2^{2^{2^2}}} - 3$	$2^{2^{65536}} - 3$ $= 2^{2^{2^{2^{2^2}}}} - 3$	$2^{2^{2^{65536}}} - 3$ $= 2^{2^{2^{2^{2^{2^2}}}}} - 3$	$2^{\underbrace{2^{\dots^2}_{n+3}}} - 3$

Ackerman function: C++ Program

```
// C++ program to illustrate Ackermann function
#include <iostream>
using namespace std;

int ack(int m, int n)
{
    if (m == 0){
        return n + 1;
    }
    else if((m > 0) && (n == 0)){
        return ack(m - 1, 1);
    }
    else if((m > 0) && (n > 0)){
        return ack(m - 1, ack(m, n - 1));
    }
}
```

```
// Driver code
int main()
{
    int A;
    A = ack(1, 2);
    cout << A << endl;
    return 0;
}
```

The Fibonacci Sequence

He gave us our 10 digit number system!

He recognized a series of numbers that often occur in nature. These are now called the Fibonacci numbers. The series starts with 0 & 1. All following numbers are the sum of the 2 previous numbers!

**Here's how it starts...
0,1,1,2,3,5.....**

Leonardo of Pisa
or Fibonacci:
Born 1175 AD

Fibonacci Series

Topic 1: Write an Algorithm to create n elements Fibonacci series

n : total elements

$a[i]$: stores elements

Fibonacci Series

- Find the ratio of successive Fibonacci numbers:
 - $1 : 1, 2 : 1, 3 : 2, 5 : 3, 8 : 5, \dots$
 - $1 : 1, 1 : 2, 2 : 3, 3 : 5, 5 : 8, \dots$
- What do you notice?

Look at the following rectangles:

Now ask yourself, which of them seems to be the most naturally attractive rectangle? If you said the first one, then you are probably the type of person who likes everything to be symmetrical. Most people tend to think that the third rectangle is the most appealing.

If you were to measure each rectangle's length and width, and compare the ratio of length to width for each rectangle you would see the following:

Rectangle one: Ratio 1:1

Rectangle two: Ratio 2:1

Rectangle Three: Ratio 1.618:1

Have you figured out why the third rectangle is the most appealing? That's right - because the ratio of its length to its width is the Golden Ratio! For centuries, designers of art and architecture have recognized the significance of the Golden Ratio in their work.

$1 : 1.618$

Fibonacci numbers

Month 0
1 pair

Month 1
1 pair

Month 2
2 pairs

Month 3
3 pairs

Are our bodies based on Fibonacci numbers?

What do you notice?

Find the ratio of

- Height (red) : Top of head to fingertips (blue)
- Top of head to fingertips (blue) : Top of head to elbows (green)
- Length of forearm (yellow) : length of hand (purple)

Report back at next class

Tower of Hanoi

Tower of Hanoi

- There are three towers
- 64 gold disks, with decreasing sizes, placed on the first tower
- You need to move all of the disks from the first tower to the last tower
- Larger disks can not be placed on top of smaller disks
- The third tower can be used to temporarily hold disks

Tower of Hanoi

- The disks must be moved within one week. Assume one disk can be moved in 1 second. Is this possible?
- To create an algorithm to solve this problem, it is convenient to generalize the problem to the “N-disk” problem, where in our case $N = 64$.

Tower of Hanoi

Tower of Hanoi

Algorithm

We can combine these steps into the following algorithm:

0. Receive n , src , $dest$, aux .

1. If $n > 1$:

a. Move($n-1$, src , aux , $dest$);

b. Move(1, src , $dest$, aux);

c. Move($n-1$, aux , $dest$, src);

Else

Display "Move the top disk from ", src , " to ", $dest$.

End if.

VIDEO

Coding

```
// ...
```

```
void Move(int n, char src, char dest, char aux)
{
    if (n > 1)
    {
        Move(n-1, src, aux, dest);
        Move(1, src, dest, aux);
        Move(n-1, aux, dest, src);
    }
    else
        cout << "Move the top disk from "
              << src << " to " << dest << endl;
}
```

Testing

The Hanoi Towers

Enter how many disks: 1

Move the top disk from A to B

Testing (*Ct'd*)

The Hanoi Towers

Enter how many disks: 2

Move the top disk from A to C

Move the top disk from A to B

Move the top disk from C to B

Testing (*Ct'd*)

The Hanoi Towers

Enter how many disks: 3

Move the top disk from A to B

Move the top disk from A to C

Move the top disk from B to C

Move the top disk from A to B

Move the top disk from C to A

Move the top disk from C to B

Move the top disk from A to B

Testing (*Ct'd*)

The Hanoi Towers

Enter how many disks: 4

```
move a disk from needle A to needle B
move a disk from needle C to needle B
move a disk from needle A to needle C
move a disk from needle B to needle A
move a disk from needle B to needle C
move a disk from needle A to needle C
move a disk from needle A to needle B
move a disk from needle C to needle B
move a disk from needle C to needle A
move a disk from needle B to needle A
move a disk from needle C to needle B
move a disk from needle A to needle C
move a disk from needle A to needle B
move a disk from needle C to needle B
```

Analysis

Let's see how many moves" it takes to solve this problem, as a function of n , the number of disks to be moved.

<u>n</u>	<u>Number of disk-moves required</u>
1	1
2	3
3	7
4	15
5	31
...	
i	$2^i - 1$
64	$2^{64} - 1$ (a big number)

Assignment-1

- 1: Write an algorithm to check whether a queue is full or empty..
- 2 Write an algorithm to merge two stack into one.
3. Write an algorithm to copy all the elements of an array into a stack.
4. Write an algorithm to copy all the elements of a stack into a queue.
- 5: Write an algorithm to find nC_r using recursion.
- 6: Write an algorithm to find first n elements of Fibonacci series.
